

Task 1 — Lab Document Practice & Prompting Report

I tried to use new chats for every question.

As we were told in class that these are memory-less and all chat history goes with next prompt.

- 1) It asks me questions to narrow down on the results. Context gives answers relevant to what I have in my mind, rather than asking a open ended question
- 2) I told the ChatGPT to answer the question..when it knows and say upfront when it does not know, but don't make guess. . The AI said on one question it does not know and asked me further question.
- 3) AI retrieves information three ways, from memory, from web and from deep search..
understanding the AI models have a cut off date of training, when we want the model to get recent information we tell like use the web or do a deep search etc. Even when we say words like current information makes it go and search on web, similarly words like research tells it do a deep search. To keep AI on its toes we tell it to cite the source.
I gave this prompt
“I gave a prompt to tell the amount of time HR needs to tell the employee before a lay off of employee in Pakistan”. It said that it depends on country to country and also organization to organization
- 4) Rather than asking AI open ended questions.. give context to narrow down on the question and the expectation. I like the approach of entering the information or context in bullet points and telling the AI the expectation for the response like bullet points, paragraphs etc..AI likes to throw more information.
- 5) Use the key word “Think hard” with providing targeted context helps to get narrow clean direction on doubtful questions.
Yes, Think hard made it to analyze the like and dislikes of a behavior mentioned in the prompt and give pros and cons also.
- 6) The model was not doing sycophancy when I asked about the time for exercise.. I think new models are not doing this as mentioned in exercise.
- 7) We most likely will not get the correct(or the finished product that we want) result in the first prompt... we have to keep refining the prompt. Giving feedback to what was missing or incorrect or correct but incomplete from the earlier answer. This means our prompt was missing out on some thing.. when we see what AI produced, we notice the things and mention in following prompt.
- 8) AI can handle images and sound but we have to cross check on the outcomes as it can hallucinate on things where it is not able to understand clearly. I gave one image to google studio and it told me the text written on it and what it means it told me in english.

- 9) I told AI to create an app for me like Angie's list and it made a superb app. Then I iterated over it and told it to have content specific to region and add dummy data.
- 10) For Data Analysis I gave the prompt mentioned in the homework and it gave the answers correctly but it was quick. Then I told it to write the code and show me, that took some seconds
- 11) We should not let an AI agent delete files automatically.
- 12) The google gemini did better on writing the linked in post .. I gave some suggestions on making the post more attractive.
- 13) I pasted a few lines from my resume from the past project and gemini gave critique on all bullet points like how to improve. Where as ChatGPT gave suggestion to only change on bullet point
