Report Document:

The idea behind the project:

The idea is that skilled people find difficult to find business in their local area. Like painters, plumbers, event decorators etc There is no way to show their work and get leads.

Secondly, home and office customers also don't know how to find skilled people locally and also to see their work, if some body is recommending them, get their contact information etc.

Prompt engineering techniques used / The AI-assisted development process/ Iterations and improvements

I told google studio AI to create a web based app similar to Angie's list but this would be used in Pakistan. And then I gave further instructions to populate with dummy data, add urdu text also.

So I gave an example of app that is already out there and gave further prompts to enhance. Like names used in Pakistan, addresses from Pakistan as well.

Problems faced and solutions applied

Not much since I gave an example of app already out there

Final working features

- 1) Skilled people / Businesses can add their listing to it.
- 2) Search results based on skills like painter, electrician
- 3) Search results based on city
- 4) clicking on some searched result shows the contact information, name, address, phone number, reviews,
- 5) clicking on What'ssApp contact tries to open the What'sApp from laptop.
